Hi there

Just wanted to say that I am very happy with NESCOE's approach and efforts to increase the ME-NH export capabilities. That seems to be the biggest bottleneck to developing any additional non-emitting generation in ME because it simply is displacing one non-emitting generation with another non-emitting generation.

IN addition to prioritizing these two items below, we would like the states to focus on improving the Keene rd interface, the most congested node in the NE system.

(1) a requirement to increase the Maine-New Hampshire interface capacity to at least 3,000 MW by 2035 and increase the Surowiec-South interface capacity to at least 3,200 MW by 2035;[4]

(2) a requirement or recommendation to increase the capacity of additional interfaces (e.g., Orrington-South, North-South, or others); or

Regards,

Aleks Mitreski
