Table of Contents

| | <u>Slide</u> |
|--|--------------|
| • Introduction | 3-8 |
| • Forecast Methodology and Assumptions | 9-13 |
| • Update to Forecast Methodology | 14-17 |
| • Future Forecast Considerations | 18-23 |
| • Forecast Inputs | 24-34 |
| • Draft 2018 Forecast – New England | 35-40 |
| • Draft 2018 Forecast – States | 41-59 |
| • Next Steps | 60-62 |

INTRODUCTION

Acronyms

- EE Energy Efficiency
- EEFWG Energy Efficiency Forecast Working Group
- FCM Forward Capacity Market
- FCA Forward Capacity Auction (FCM)
- CSO Capacity Supply Obligation (FCM)
- ARA 3 Third Annual Reconfiguration Auction (FCM)
- ICR Installed Capacity Requirement
- PA Program Administrator
- RGGI Regional Greenhouse Gas Initiative
- SBC System Benefit Charge
- CELT 10-year forecast of Capacity, Energy, Loads and Transmission

Introduction

- This presentation contains the draft EE forecast for the period 2019 through 2027
- The forecast estimates reductions in energy and demand from state-sponsored EE programs in the New England control area by region and state (CT, MA, ME, NH, RI, VT)
- The data used to create the forecast originates from state-sponsored EE Program Administrators and state regulatory agencies
- The draft forecast excludes the results of FCA #12
 - FCA #12 results will be included in final forecast

Introduction

Process

- This forecast follows the same fundamental forecast process and methodology used in prior years, starting in 2012
- The EE forecast is based on average production costs, peak-to-energy ratios, and projected budgets of state-sponsored EE programs
- The Energy-Efficiency Forecast Working Group (EEFWG) provided input during two prior meetings on October 20, 2017 and December 15, 2017
- The EE forecast is updated annually
- The final EE forecast will be incorporated into the CELT report

Introduction

Impacts

- The EE forecast is used in ISO studies including:
 - Long-term transmission planning studies
 - Economic planning studies
- EE forecast will not impact:
 - ICR/Local Sourcing Requirement/Maximum Capacity Limit/Demand Curves
 - FCM auctions
 - FCM related reliability studies (qualification, de-list bid reliability reviews)

Introduction

Looking Forward

- The ISO will accept formal public comments on this draft forecast through March 6, 2018
 - Please submit comments to: eeforecast@iso-ne.com
 - Comments will be posted at: <http://www.iso-ne.com/eefwg>
 - Background information is available at: <http://www.iso-ne.com/eefwg>
- The ISO will issue the final EE forecast by May 1, 2018 as an updated slide deck
 - A generalized characterization of the forecast process can be found in the “Energy-Efficiency Forecast Background Report” available at https://www.iso-ne.com/static-assets/documents/2016/05/Final_EEF_Background_Report_050116.pdf

FORECAST ASSUMPTIONS AND METHODOLOGY

Forecast Model

General Assumptions

- Annual EE budgets provided by the Commissions or representatives on their behalf were used in the model and held constant in years after the latest approved budget
- Production cost baselines were derived from a three-year average of recent performance
- Peak-to-Energy Ratios were derived from a three-year average of recent performance and held constant through the forecast period
- Inflation rate set at 2.5% per year
- Current CELT energy forecast used in conjunction with SBC rates to forecast SBC dollars
- FCM revenue has no effect on overall budget in ME, VT, MA, and RI

Forecast Model

Input Assumptions

- 2017 CELT Energy Forecast
- 2017 CELT FCM CSOs and FCA #11 clearing price used for calculating budgets
 - Final forecast will use FCA #12 clearing price
- Production Cost: PA 2014-2016 average
- Peak-to-Energy Ratio: PA 2014-2016 average
- Production Cost Escalation Rate: 2.5% inflation + 1.25% graduated rate (starting in year 1)
- No Budget Spend Rate deduction

Forecast Model

Assumptions Regarding the Forward Capacity Market

- FCM clearing price was held constant at \$5.3/kW-month[†], FCA clearing price for FCA #11
 - Final forecast will use FCA #12 clearing price of \$4.63/kW-month[†]
- ISO assumes that all achieved EE capacity will be bid into and clear in future FCA's[‡]

[†] FCA clearing price used is for modeling purposes only and should not be considered an indication of future clearing prices.

[‡] The ISO assumption that all achieved EE capacity would be bid into and clear in future FCA's is only for modeling purposes and should not be considered an indication of any future FCA outcome.

Forecast Model

Fundamentals

- Compute Annual Energy Savings

$$\text{Annual Energy Savings} = \frac{(1 - \text{Budget Spend Rate Modifier}) * (\text{Budget})}{(\text{Production Cost}) * (\text{Production Cost Escalator})}$$

- Compute Annual Demand Savings

$$\text{Annual Demand Savings} = (\text{Annual Energy Savings}) * (\text{Peak-to-Energy Ratio})$$

- Where:

- Budget Spend Rate Modifier (%) = % to reduce state budgets
- Budget (\$) = \$SBC + \$RGGI + \$FCM + \$Policy
- Production Cost (\$/MWh) = unit cost to develop a MWh of annual savings
- Production Cost Escalator(%) = % increase in annual production cost
- Peak-to-Energy Ratio (MW/MWh) = ratio of annual demand to annual energy savings

UPDATE TO FORECAST METHODOLOGY

Incorporating ARA 3 Qualification

2018 Update to Forecast Methodology

Background

- FCM values are used as the starting point for the EE forecast and determine the overall magnitude of the EE forecast
- In 2012 and 2013 the actuals in the EE forecast were FCM CSO as acquired through the primary FCA
 - The CSO values were found to under represent EE in the market
 - Projects that delisted or failed to clear in the primary FCA were still in operation
- Beginning in 2014, the EE forecast actuals were represented by FCM Existing Qualified + New Cleared
 - Existing Qualified + New Cleared is a value determined over 3-years prior to the start of the relevant Capacity Commitment Period
- Qualification for ARA 3 is held just a few months prior to the start of the relevant Capacity Commitment Period
- ISO has observed that ARA 3 Qualification diverges from, and is higher than, Existing Qualified + New Cleared, especially in recent years

2018 Update to Forecast Methodology

Background

- In early Capacity Commitment Periods the Existing Qualified + New Cleared values line up with ARA 3 Qualification
- In more recent years the qualification values diverge
 - Projects come online early and participate in ARA 3 for earlier Capacity Commitment Periods
 - Terminated projects are removed from ARA 3 Qualification
- ARA 3 Qualification values are the best FCM indicator of what will actually be installed and operating for a given Capacity Commitment Period

2018 Update to Forecast Methodology

Structural Changes

- Replace Existing Qualified + New Cleared with ARA 3 Qualification
 - ARA 3 Qualification is the most up to-date annual FCM quantity available for any given Capacity Commitment Period
 - ARA 3 Qualification accounts for projects that come online early as well as those that undergo full or partial termination
- Impacts
 - Year 1 of the forecast will be ARA 3 Qualification (fixed)
 - Years 2 through 10 of the forecast will be forecast values
 - Forecast methodology will remain unchanged (budgets, production costs, peak-to-energy ratios)

FUTURE FORECAST CONSIDERATIONS

Expiring Measures

Incorporating Expiring Measures

Recap

- During the October 20, 2017 EEFWG meeting the ISO introduced the idea of incorporating future expiring measures into the EE forecast
 - The ISO's Energy Efficiency Management (EEM) database would be the source for expiring measures
 - During each forecast cycle, the EEM database would be queried to compute future expiring measures based on the currently available data
 - The computation of future expiring measures would mimic the calculation as it is executed during the FCM qualification process
 - Future expiring measures would then be subtracted from the EE forecast

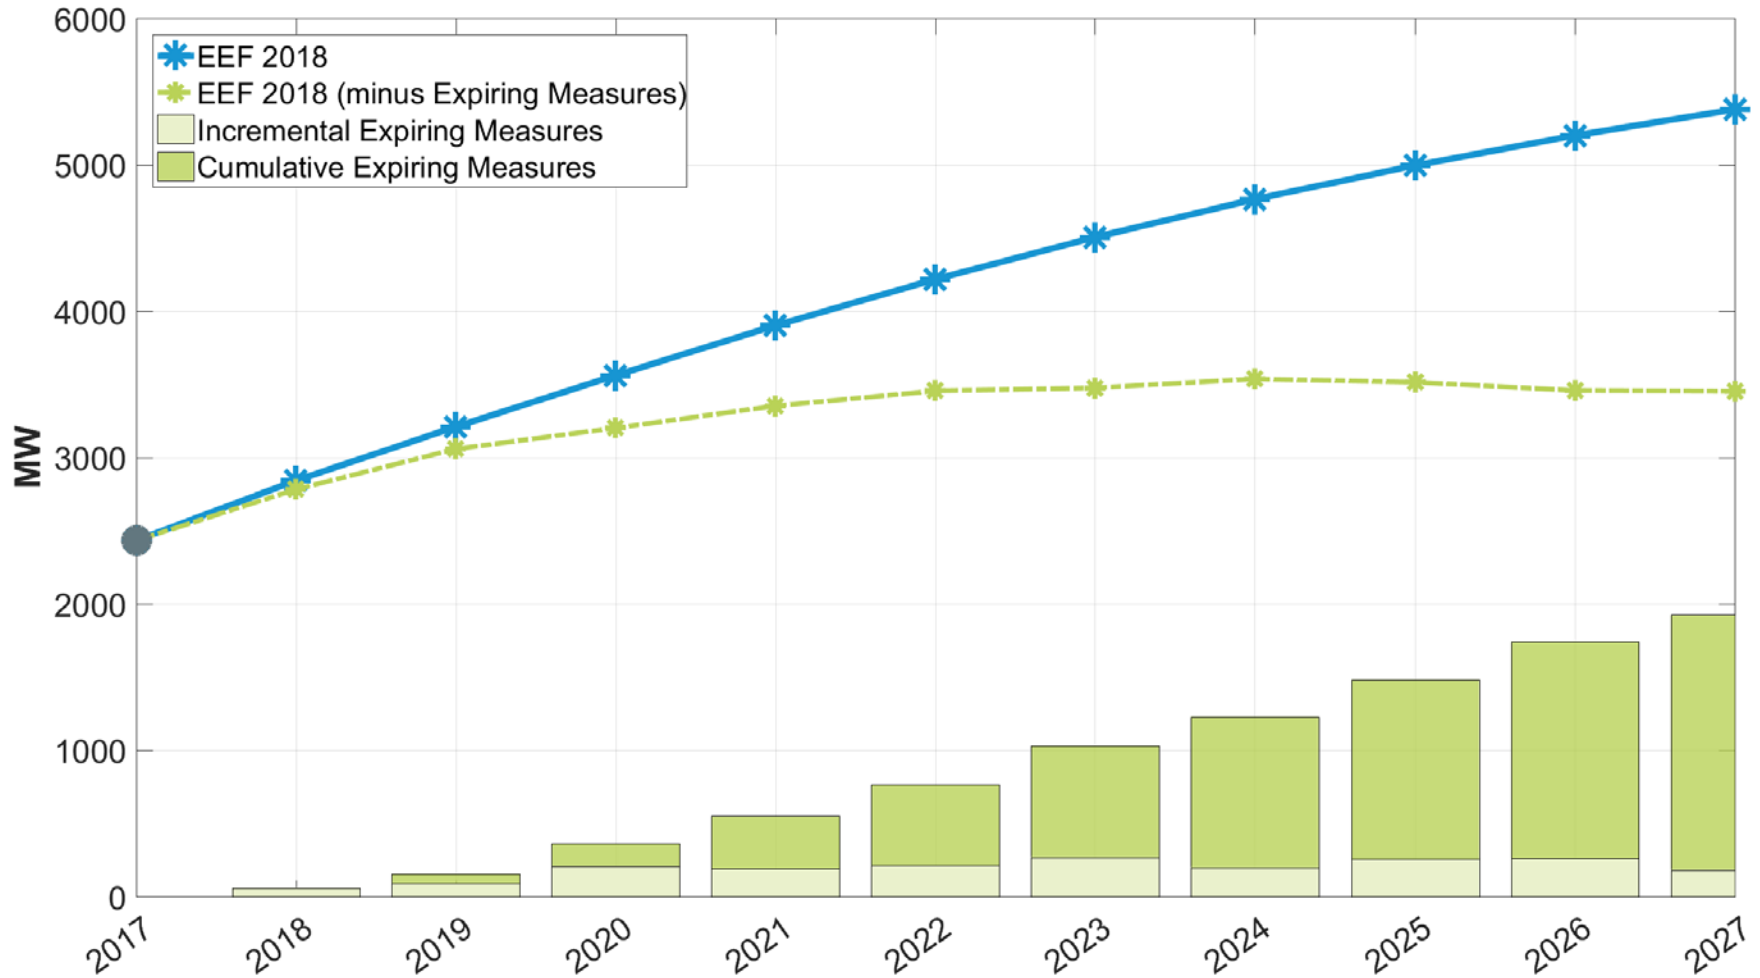

Incorporating Expiring Measures

Recap

- The results shown at the October 20, 2017 meeting did not fully account for the cumulative impact of expiring measures over the forecast horizon
- The next slide shows an example of what would result from fully incorporating the cumulative nature of expiring measures into the Draft 2018 EE Forecast

Incorporating Expiring Measures

Potential Impact on Regional Draft 2018 EE Forecast

More Work is Needed on Expiring Measures

- For the 2018 EE Forecast the ISO has decided not to incorporate expiring measures
- Preliminary comparisons of the Draft 2018 EE Forecast and forward-looking expiring measures suggest that growth in market-facing EE may flatten out within the current 10 year forecast horizon
- Gaining a fuller understanding of the implications of expiring measures to the EE forecast process and performing additional analysis on the expiring measures themselves will be an important work effort in 2018 and 2019

Next Steps on Expiring Measures

- The ISO will continue to work with stakeholders to better understand the nature and impacts of expiring measures
 - Are there trends within the expiring measures data that are relevant to the EE forecast?
 - When EE exits from the market, what are the chances it ceases to provide load reductions?
 - Are there certain measure types that are more likely to persist savings beyond their prescribed measure life?

FORECAST INPUTS

Summary of Program Administrator Data and Model Parameters

Summary of Program Performance Changes

2015 PA Data Versus 2016 PA Data

- Production Cost
 - Decreased in majority of states
 - Decreased for New England
- Peak-to-Energy Ratio
 - Decreased in majority of states
 - Decreased slightly for New England
- Budget Spend Rate
 - Decreased in majority of states
 - Decreased for New England

Program Data Summary

| Period | Budget (\$1000's) | Total Costs (\$1000's) | Achieved Annual Energy (MWh) | Dollars per MWh | Achieved Summer Peak (MW) | Dollars per MW | % Energy Achieved | % Budget Spent | % Peak Achieved | Peak to Energy Ratio Achieved (MW/GWh) | Achieved Lifetime Energy (MWh) | Lifetime Dollars Per MWh |
|----------------------|-------------------|------------------------|------------------------------|-----------------|---------------------------|----------------|-------------------|----------------|-----------------|--|--------------------------------|--------------------------|
| New England | | | | | | | | | | | | |
| 2011 | 665,087 | 518,865 | 1,575,302 | 329 | 200 | 2,588,882 | 90% | 78% | 75% | 0.127 | 17,638,158 | 29 |
| 2012 | 745,761 | 648,848 | 1,723,357 | 377 | 221 | 2,930,052 | 98% | 87% | 86% | 0.128 | 18,384,080 | 35 |
| 2013 | 727,655 | 707,930 | 1,833,883 | 386 | 254 | 2,787,351 | 109% | 97% | 105% | 0.138 | 20,414,118 | 35 |
| 2014 | 857,984 | 862,384 | 2,063,624 | 418 | 275 | 3,140,299 | 139% | 101% | 99% | 0.133 | 18,120,338 | 48 |
| 2015 | 897,172 | 923,581 | 2,375,192 | 389 | 333 | 2,774,547 | 123% | 103% | 129% | 0.140 | 26,658,969 | 35 |
| 2016 | 976,266 | 908,011 | 2,454,794 | 370 | 335 | 2,707,974 | 117% | 93% | 122% | 0.137 | 23,522,755 | 39 |
| Avg 2013-2015 | 827,604 | 831,298 | 2,090,899 | 398 | 287 | 2,900,732 | 123% | 100% | 111% | 0.137 | 21,731,142 | 39 |

* Policy dollars are funds not from SBC, RGGI, or FCM revenues. Policy dollars are present in states that set the SBC rate based on budget alone (VT and ME) and states that have a surcharge to cover the balance of the total budget (MA and CT). MA is adjusted to reflect a lower portion of budget coming from SBC due to higher FCM revenue.

NEXT STEPS

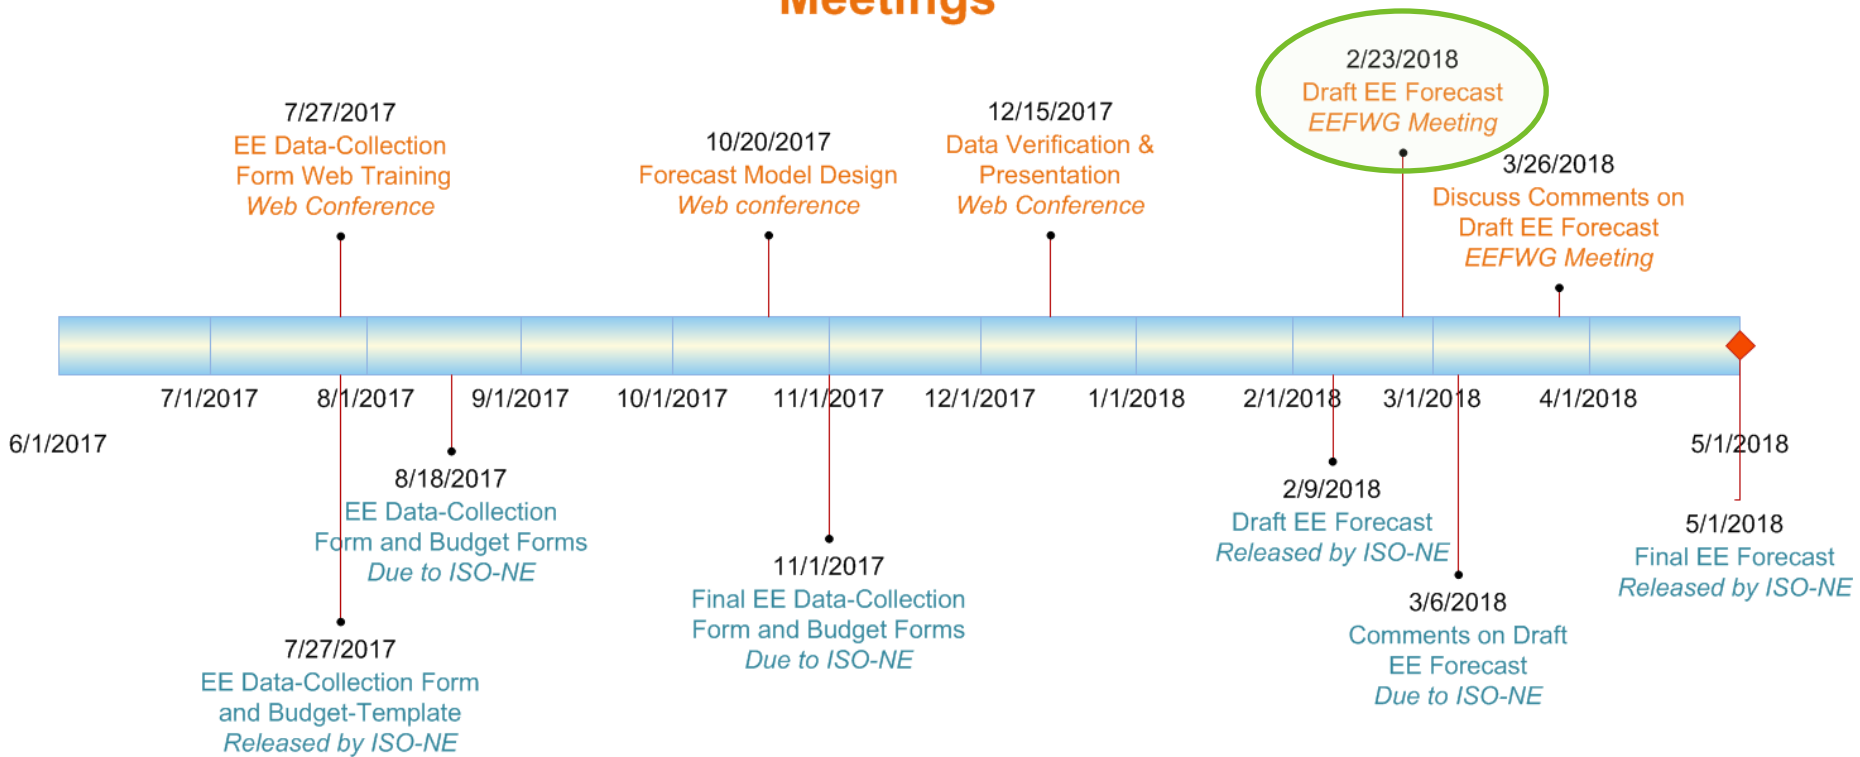

Looking Ahead

- **March 6, 2018** – Comments on the Draft EE Forecast due to ISO New England (eeforecast@iso-ne.com)
- **March 26, 2018** – Energy Efficiency Forecast Working Group (EEFWG) meeting to discuss comments on the Draft EE Forecast
- **March 14, 2018** – Presentation of the Draft EE Forecast to the Planning Advisory Committee
- **May 1, 2018** – Final EE Forecast released by ISO New England
